

ClickBlocks\Data\Validators\Regex

General information

Inheritance	ClickBlocks\Data\Validators\Validator
Child classes	no
Interfaces	no
Source	Framework/data/validators/regex.php

This validator validates that the given value matches to the specified regular expression pattern (PCRE). Example:

```
// Creates Regex validator.
$validator = new Validators\Regex();
// Sets regular expression: only characters from "a" to "z" are valid.
$validator->pattern = '/^[a-z]*$/';
// Inverts the regular expression: only strings
// that not containing characters from "a" to "z" considered valid.
$validator->inversion = true;
// Verifies the given values.
echo (int)$validator->validate('abcde'); // output is 0.
echo (int)$validator->validate('12345'); // output is 1.
```

Public non-static properties

pattern

```
public string $pattern
```

The regular expression to be matched with.

inversion

```
public boolean $inversion = false
```

Validates a value. The method returns TRUE if the given value matches the specified regular expression. Otherwise, the method returns FALSE.

Public non-static methods

validate()

```
public boolean validate(string $entity)
```

\$entity	string	any string to validate.
-----------------	--------	-------------------------

Validates a value. The method returns TRUE if the given value matches the specified regular expression. Otherwise, the method returns FALSE.
