

ClickBlocks\Data\Converters\Converter

General information

Inheritance	no
Child classes	ClickBlocks\Data\Converters\Type, ClickBlocks\Data\Converters\Text, ClickBlocks\Data\Converters\Collection.
Interfaces	no
Source	Framework/data/converters/converter.php

The Converter class is the base abstract class for all classes of converters. If you want to create your own converter class you need to inherit it from the base class and define the method **converter**.

Public static methods

getInstance()

```
final public static ClickBlocks\Data\Converters\Converter getInstance(string $type, array $params = [])
```

\$type	string	the converter type name.
\$params	array	the values of the converter properties.

Creates and returns a converter object of the required type. Converter type can be one of the following values: "type", "text", "collection".

Public non-static methods

convert()

```
abstract public mixed convert(mixed $entity)
```

\$entity	mixed	some value to be converted.
----------	-------	-----------------------------

Converts the entity from one data format to another according to the specified options.
