

# ClickBlocks\Data\Validators\JSON

## General information

---

<b>Inheritance</b>	ClickBlocks\Data\Validators\Validator
<b>Child classes</b>	no
<b>Interfaces</b>	no
<b>Source</b>	Framework/data/validators/json.php

The JSON validator compares the given JSON with another JSON or checks whether the given JSON has the specified structure. The logic of JSON schema validation is determined by [the relevant specification](#). Example:

```
// Creates JSON validator.
$validator = new Validators\JSON();
// We will check JSON schema.
$validator->schema = '... some json schema goes here ...';
// Validates the given JSON.
$json = '... my json goes here ...';
echo (int)$validator->validate($json);
```

## Public non-static properties

---

### json

```
public string $json
```

JSON string or path to the JSON file to be compared with.

### schema

```
public string $schema
```

The JSON schema which the validating JSON should correspond to.

## Public non-static methods

---

### validate()

```
public boolean validate(string $entity)
```

<b>\$entity</b>	string	the JSON for validation.
-----------------	--------	--------------------------

Validates a JSON string.
