

ClickBlocks\Data\Validators\XML

General information

Inheritance	ClickBlocks\Data\Validators\Validator
Child classes	no
Interfaces	no
Source	Framework/data/validators/xml.php

By using XML validator you can easily compare the given XML with another XML or checks whether the given XML has the specified structure.
Example:

```
// Creates XML validator.
$validator = new Validators\XML();
// Sets path to the sample XML file.
$validator->xml = '/path/to/xml';
// Sets the XML schema to matched with.
$validator->schema = '/path/to/xml/schema';
// Validation.
$xml = '... some XML goes here ...';
echo (int)$validator->validate($xml);
```

Public non-static properties

xml

```
public string $xml
```

XML string or path to the XML file to be compared with.

schema

```
public string $schema
```

The XML schema or path to the XML schema which the validating XML should correspond to.

Public non-static methods

validate()

```
public boolean validate(string $entity)
```

\$entity	string	some XML string to validate.
-----------------	--------	------------------------------

Validates an XML string. It returns TRUE if the given XML matches with the sample XML or/and has the specific schema. Otherwise, it returns FALSE.
