CLI contains some helpful methods to work with command line.

Public static methods

getArguments()

```
public static array getArguments(array $options)
```

$options	array	names of the options. Each option can be an array of different names (aliases) of the same option.

Returns values of command line options. Method returns FALSE if the script is not run from command line. For example, let's we have the following command: `myscript.php f 1 -f 2 --p v1 -p2 v2 p3 v3 p4 v4`. Then we will able to get necessary command parameters via the following code:

```
$args = CLI::getArguments(['f', ['--p', '-p1', 'p1'], ['-p2', 'p2'], ['-p3', 'p3']]);
print_r($args);
```

The above example will output:

```
Array
(
    [f] => 1
    [--p] => v1
    [-p2] => v2
    [p3] => v3
)
```
